This work has been supported by the European Regional Development Fund within the Activity 1.1.1.2 “Post-doctoral Research Aid” of the Specific Aid Objective 1.1.1 “To increase the research and innovative capacity of scientific institutions of Latvia and the ability to attract external financing, investing in human resources and infrastructure” of the Operational Programme “Growth and Employment” (No. 1.1.1.2/VIAA/3/19/393).

Research Application identification No.: Nr.1.1.1.2/VIAA/3/19/393

The implementer of the Research: Riga Technical university

Post-doctorate: Dr. sc. ing Līga Gaile

Title of the Research: “Structural Health Monitoring of Buildings under Ambient Vibrations”

Work package: WP1.

Deliverable: D.1.1.

**Description of state-of-the-art methods and algorithms of
data processing techniques and MEMS sensing technologies
applicable for the global SHM of building structures**

Table of Contents

1. Annotation.....	4
2. Introduction.....	5
3. Vibration characteristics of low and medium-rise buildings	11
Frequency / period of buildings	12
Damping ratios of buildings.....	14
Mode shapes of buildings	14
4. Ambient vibration sources and their effects on buildings	15
Ambient vibration source – normal traffic and train	16
Ambient vibration source – wind.....	18
Ambient vibration source – industrial machines	19
Ambient vibration source – low seismic noise	19
Presence of harmonics in Ambient vibration source	21
5. Full-scale experimental studies and identification techniques.....	21
Enhanced Frequency Domain Decomposition (EFDD)	24
Stochastic Subspace Identification (SSI).....	24
6. On analytical models of low and medium-rise buildings	36
7. Data normalization and signal processing techniques	36
8. Environmental and operational effects on dynamic parameters	40
9. Damage identification and localization	44
10. MEMS and sensor networks	51
Signal-to-noise ratio.....	57
MEMS calibration.....	57
Synchronization of data	58

Optimal placement and sensor networks	58
11. Aspects of SHM system standardization.....	61
12. Summary	63
13. Further research.....	64
14. References	66

Structural health monitoring (SHM) – the method of evaluating and monitoring structural health is a vast topic. This report focuses on the review of SHM (structural health monitoring) vibration-based (VBM) state-of-the-art methods with potential application to building structures especially to the low or medium-rise buildings that characterize with small vibration amplitude region during normal operation. Reviewed SHM methods are associated with normal loading conditions (ambient vibrations) affected by operational, environmental factors and ageing of the structure. The focus maintained on low – cost sensors and sensor network, e.g. microelectromechanical system (MEMS) potential application to the object in the report.

Instead of giving the detailed mathematical description of numerous methodologies and algorithms, this report intended to summarise relevant information and attempting to structuralize important aspects of SHM applicable to the low or medium-rise buildings. It is addressed the key issues and covered following topics: topicality of the review, general scheme of SHM system, typical dynamic characteristics of low and medium-rise buildings and modelling issues, typical ambient vibration sources, identification techniques of operational modal analysis (OMA), data normalization and signal processing techniques including problems induced by operational and environmental factors, damage identification and localization techniques and relevant microelectromechanical systems for sensing.

As currently transferring research into practice is viewed as a critical milestone report summarises performed full-scale experimental research on medium-rise buildings between 2002 and 2019 in different countries. This highlight successfully used sensing technologies and OMA identification algorithms in practice. Additionally, attention paid to developments of practical guidelines in the field of SHM.

Based on the review, some challenges, suggestions, and future trends in SHM of low or medium-rise buildings utilizing VBM approach proposed.
